Foreword

I was planning on editing this document. But then, I remembered I never edited anything in school, so why start now? Originally, I was writing a few pieces to flesh out my ideas about each element. I was going to dump them on you guys with zero context, but then I thought against it. So, if you want the original, authentic experience, read the last section first. If you want a coherent reading experience, start from the beginning.

TL;DR

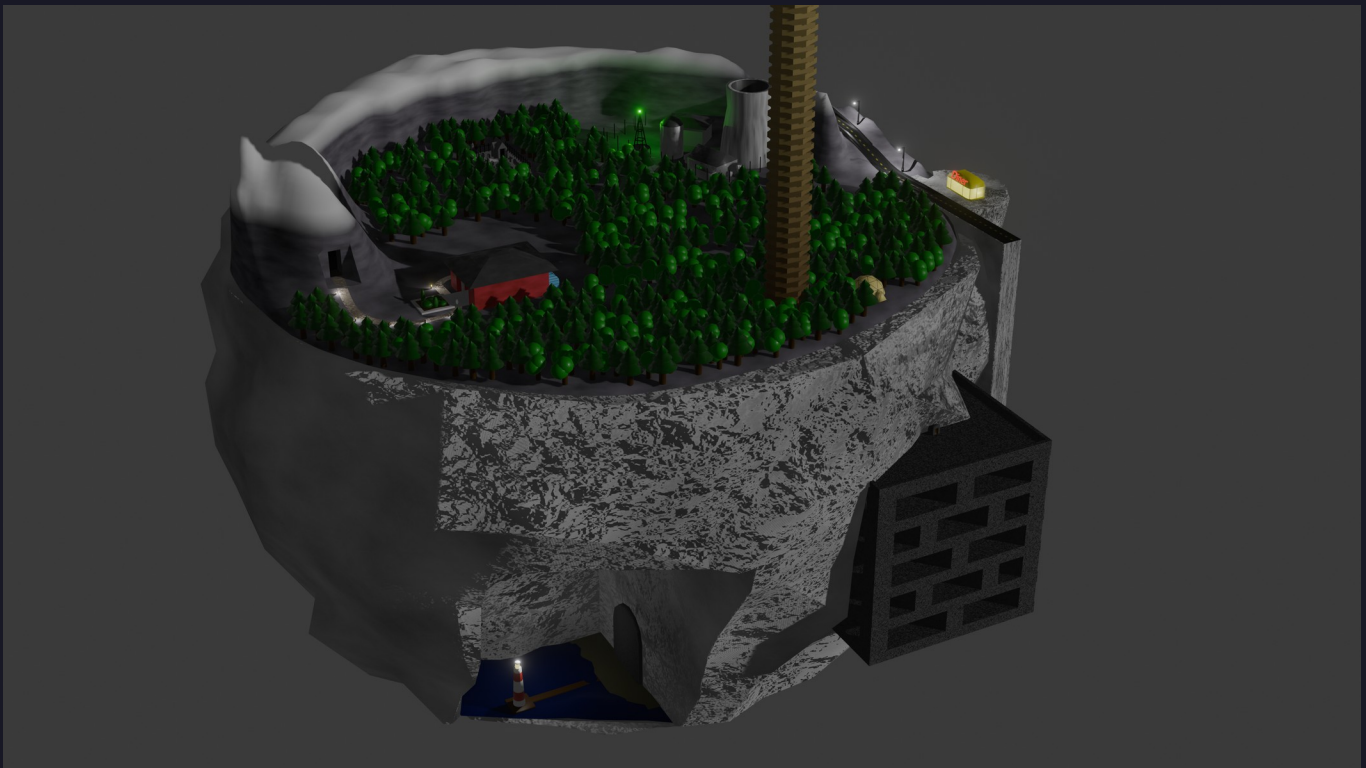

Okay, so the central mechanic of this game is the *transmutation system*. There are 8 Elements, each named after a color. When two elements come in contact, they transmute into a third. So, for instance:

Red + Yellow => Orange

See, its simple, nothing else to it (he says, lying as easily as he breathes). Both inanimate and living matter can be transmuted, forming the basis of the puzzle and combat systems.

Right, so there's 8 Elements: Blue, Purple, Magenta, Red, Orange, Yellow, Green, and Cyan.

I've tried to give each one its own aesthetic and vibe, so Green is poison, Red is blood, Magenta is clown, typical stuff like that. As people interact with elemental energy, they'll develop an *alignment*, where they permanently become one Element (if that sounds like it would break the central mechanic, put a pin in that). Alignment comes with an array of physical, behavioral, and magical traits.

Final TL;DR, the game takes inspiration from liminal spaces and the backrooms. Currently the world is called Forlorn, but that's not 100% set yet. The current map is shown above. The demo takes place underground, in the Hotel, which isn't depicted lol. Its right behind the section with the lighthouse at the bottom.

Meta-commentary, or Explaining my Questionable Decisions

Transmutation

If I'm being honest, creating weird systems and mechanics is my favorite part of game design. For this project, I created the idea of a transmutation-based type system first. Everything else was created as a means to contextualize and justify this central conceit. Even the elements, which you would think would play a foundational role, were originally just placeholders. I think they work best as colors, but that choice was really just a happy accident.

I know the elemental system is complex, esoteric even. And, unfortunately, that is what I enjoy making. My dream game (to make) would be cross between Noita and Ena Dream BBQ. A surrealist fever dream with an infinitely complex central mechanic. I'm not aiming for mass market appeal, if I can get just one hour+ long video essay about my game, I'll die happy.

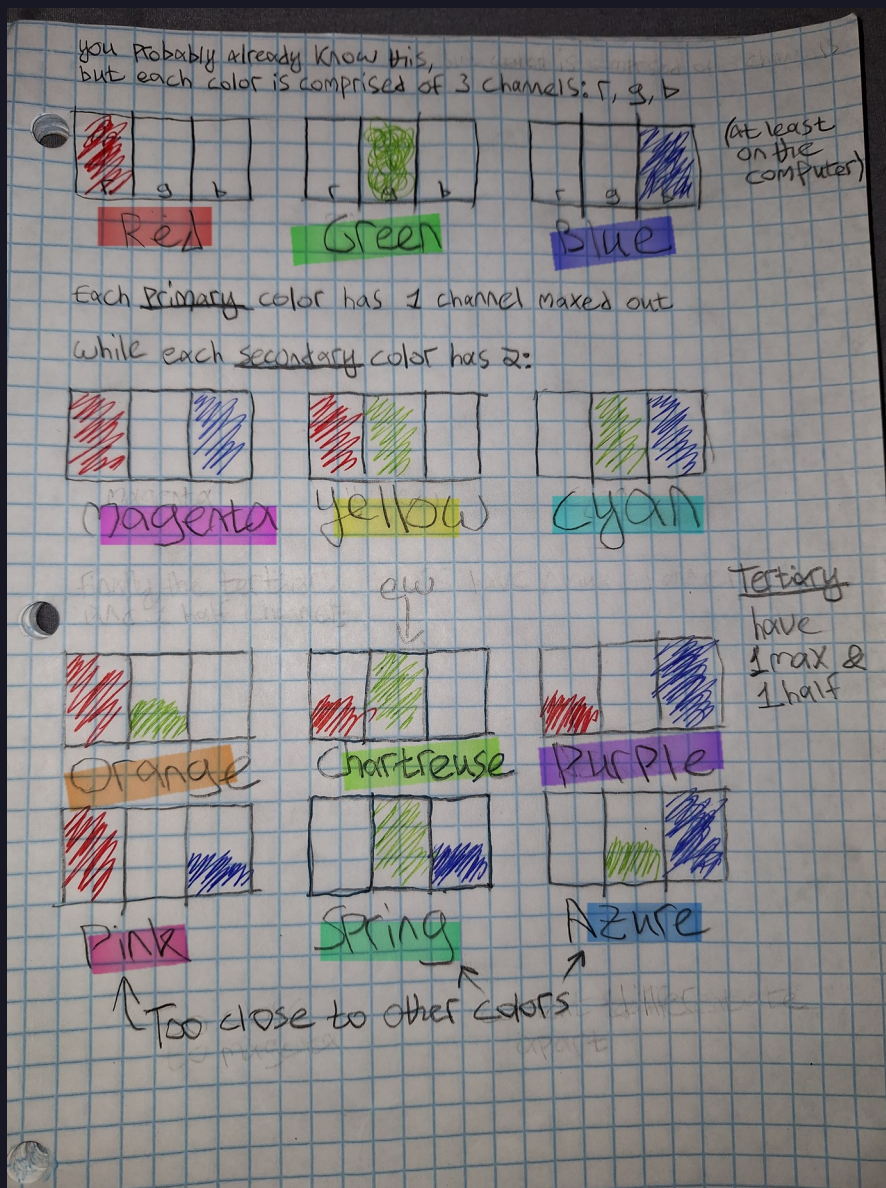

Hopefully, that helps contextualize most of the questionable design decisions I've made. I want the game to be fun, but I want to enjoy making it more (this is my hobby, after all). It'd be great to get both, of course, but we'll see. Ultimately, I'm just a programmer with a god complex and overinflated sense of my own abilities, but I'm making a 3D somewhat-open-world RPG, so you already knew that :)

Selecting the Elements

The idea for the elemental system originated from the transmutation reactions from Cassette Beasts. In this game, when an ice-type is hit with a fire-type attack, they transmute into a water-type. I wanted to make a type system based entirely on this idea.

Initially, I wanted the end result to look something like Fire + Wood = Smoke. My plan was to use colors as placeholders until I found an "interesting" looking type chart, then retrofit the labels (in hindsight, a truly insane way to go about doing this).

I could have used letters or numbers, but colors made the type chart easier to read at a glance. Figuring the best way to test this process was mixing the colors, I started plugging them into an online paint mixer. This was quickly followed by the realization that I did not know what constituted an "interesting" type chart. So, with a "functional" system, I decided to move forward.

This is how I selected the colors. Its the primary and secondary colors of light, plus the more distinct tertiary colors, minus chartreuse.

I don't like chartreuse.

Hexcodes are a simple way to show this information. They're composed of 3 2 digit numbers, so 6 digits total. They're base 16 numbers, however, so their values go from 0-9 then A-F. All that's really important is that FF means max channel, 80 is half channel, and 0 is empty channel. This is relevant to the section below.

FFFFFF
808080
000000

The following table shows every possible combination of colors using the 8 I selected, along with which of the following rules I applied:

1. A color mixing with another cannot form itself. So Red + Orange = Orange isn't valid.
2. If the result is a valid element, then its result is straightforward (Blue + Magenta = Purple).
3. If the result is just a darker version of an element, it should be that element (Red + Green = Dark Yellow = Yellow).
4. If a color channel is maxed out, then the result should be that color (Yellow + Cyan = Green, b/c green channel is FF).
5. The result doesn't resemble any of the elemental colors, there's no reaction.

Color 1	Color 2	Raw Result	Elemental Match	Rule
FF0000	00FF00	808000	FFFF00	3
FF0000	0000FF	800080	FF00FF	3
FF0000	FFFF00	FF8000	FF8000	2
FF0000	00FFFF	808080	None	5
FF0000	FF00FF	FF0080	None	1
FF0000	FF8000	FF4000	None	1
FF0000	8000FF	C00080	FF00FF	3
00FF00	0000FF	008080	00FFFF	3
00FF00	FFFF00	80FF00	None	1
00FF00	00FFFF	00FF80	None	1
00FF00	FF00FF	808080	None	5
00FF00	FF8000	80C000	FFFF00	3
00FF00	8000FF	408080	00FFFF	3
0000FF	FFFF00	808080	None	5
0000FF	00FFFF	0080FF	None	3
0000FF	FF00FF	8000FF	8000FF	1
0000FF	FF8000	804080	8000FF	3
0000FF	8000FF	4000FF	None	1
FFFF00	00FFFF	80FF80	00FF00	4
FFFF00	FF00FF	FF8080	FF0000	4
FFFF00	FF8000	FFC000	FF0000	4
FFFF00	8000FF	C08080	None**	5
00FFFF	FF00FF	8080FF	0000FF	4
00FFFF	FF8000	80C080	None**	3**

00FFFF	8000FF	4080FF	0000FF	4
FF00FF	FF8000	FF4080	FF0000	4
FF00FF	8000FF	C000FF	0000FF	4
FF8000	8000FF	C04080	FF00FF	3

**This mistake, this mistake right here... This is 1 of 2 data entry errors I made. This one is much more of a problem, as it has *ramifications*. See, one of the weaknesses of this mechanic is how difficult it is to memorize the type chart. But there's a few shorthand rules you can use.

1) Most reactions that include a primary color are fairly straightforward:

Red + Blue => Magenta

Red + Green => Yellow

Blue + Green => Cyan

Red + Yellow => Orange

2) These ones technically use the same principle, but its necessary to understand that Orange and Purple are functionally Red and Blue:

Orange + Blue => Magenta

Red + Purple => Magenta

Orange + Purple => Magenta

Orange + Green => Yellow

Purple + Green => Cyan

Cyan + Magenta => Blue

3) Reactions that are between secondary/tertiary colors can be understood by looking at which channels overlap:

Yellow + Cyan => Green

Yellow + Magenta => Red

Yellow + Orange => Red

Purple + Magenta => Blue

Purple + Cyan => Blue

Orange + Magenta => Red

But this principle doesn't apply for these 2 reactions:

Orange + Cyan => Green (80C080)

Yellow + Purple => Red (C08080)

So part of what annoys me about this mistake is that I acknowledged the Orange + Cyan reaction in my original notes. To me that reaction looks more like Green than the second reaction looks like Red, but if one is applied, then both should be. Now my original reasoning for why I didn't include these reactions was because of the second principle above (Orange≈Red and Purple≈Blue). But I'm on the fence.

I think the system would be easier to understand if I add these reactions, but I'm reluctant to. Why? Because of this thing:

This is the *Transmutation Map*.

It was made in Blender.

Should it have been made in Blender?

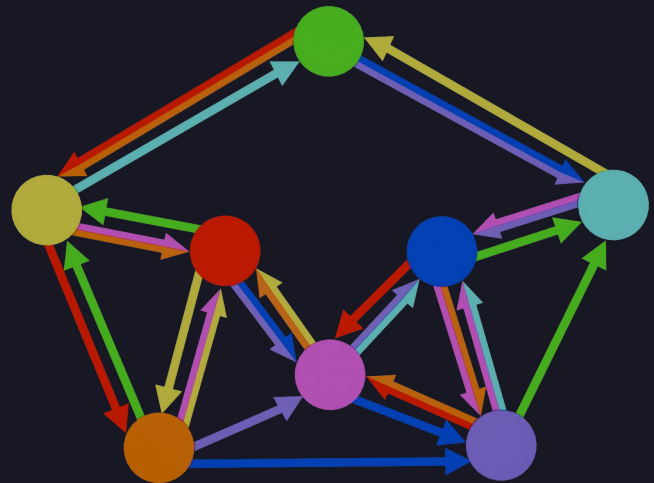

No.

But I made it in Blender, after struggling to make it in Gimp.

Remaking the map will be a pain.

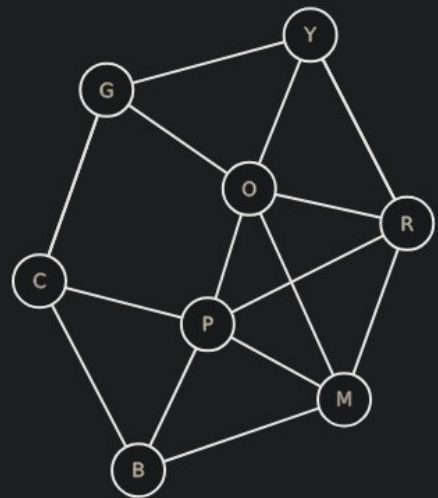

Plus, its much harder to read when any of the arrows cross themselves.

And I can't find any configuration that includes those reactions that don't have any intersections.

This is the best I could find:

I will, eventually, make this change. But that's a future Dlarv problem.

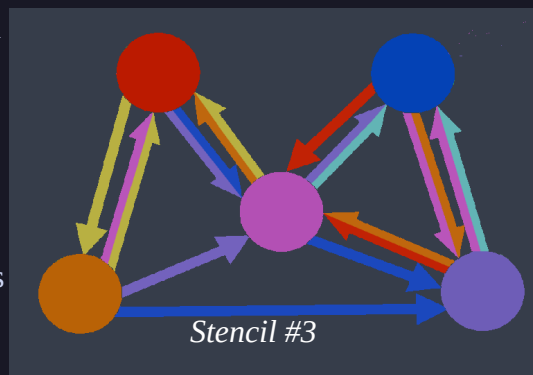

Initially, I was using a more traditional type chart. But the map does a better job of showing this info, I think.

Stencils

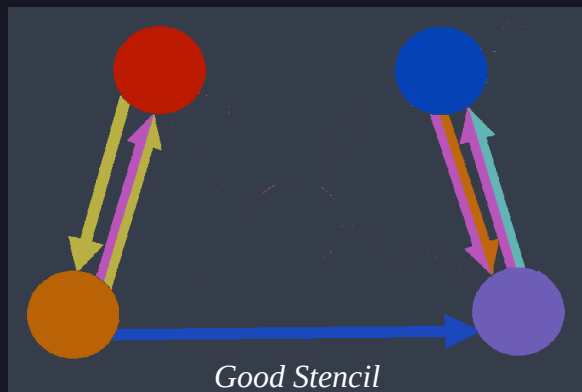

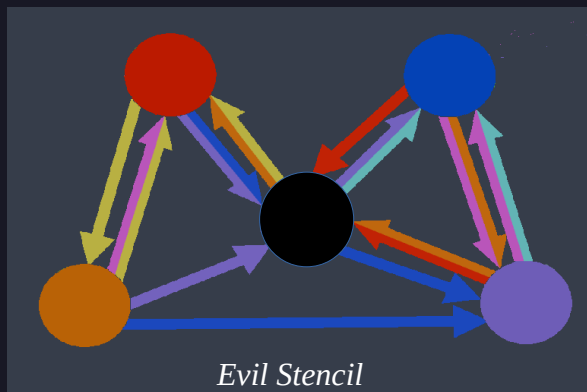

I realized I didn't really explain why remaking the transmutation map would be so difficult.

In order to avoid overwhelming the player, I added what I call stencils. These hide sections of the transmutation map, allowing the player to slowly acclimate to the system.

The circles represent the valid combatant types, while the arrows represent valid attack types. So I can use stencil #3 as long as I ensure there are no **Green** attacks and combatants are one of the five colored circles shown.

I programmed the ability to hide any combination of circles and arrows. So for stencil #3, I tell the map to hide **Green** arrows and **Yellow**, **Green**, and **Cyan** circles. But I needed a way to hide, say, the **Cyan** circles without hiding the **Cyan** arrows. This was fairly simple. The **Cyan** arrows and circle are *slightly* different hues. So the code looks at each pixel and determines whether it should be hidden.

So, I can hide the **Magenta** dot, but now I have a bunch of arrows pointing into the void. This felt cluttered. To fix this, I need all of the edges to know which two dots they're connected to. This data was encoded into the alpha channel of each pixel. So the **Yellow** and **Magenta** arrows between **Red** and **Orange** are 91% opacity. The **Blue** line between **Orange** and **Purple** is 94%.

After rendering the image in Blender, I opened it in Gimp to correct each pixel color and alter the alpha values. Maybe if I had created the image in Gimp to begin with, this wouldn't have been so tedious. But because it was a render, I had to manually adjust each pixel in order for these tricks to work. The image used for these stencil (which isn't used in game, just for demonstrative purposes here) aren't properly cleaned up, so you can see artifacts. It doesn't do this in game.

Alignment

The player, as well as every(most?) humans that find themselves on Forlorn, has been isekaied. They fell thru a crack in reality and landed in this strange, liminal world. The matter in their bodies starts off as carbon/etc, with them slowly changing into the color-based matter native to the island. This process is pretty much inevitable, but it can be sped up by using magic, getting injured, etc. Alignment is what happens when this conversion finishes, permanently locking their core into one element. Great enough damage can force this core to transmute, but this is always fatal. As such, complex organisms (like the player) have an outermost shell which can react freely. This acts as a pressure release valve, directing alchemic energy away from the core. In gameplay, the player has a primary and secondary type.

In lore, alignment comes with several physical, behavioral, and magical traits. I tried to give each Element its own flavor. I also wanted to explore the idea of a magic system that mutates you, making you better at wielding its power, at the detriment of other skills. Alignment is a big commitment. It also has some body horror to it, an aspect I want the player's main companion's arc to explore. Some powerful monsters used to be mages, though I've scaled this idea back, mostly because I'm thinking I want the world to feel a bit more empty and alien (less people => less monsters).

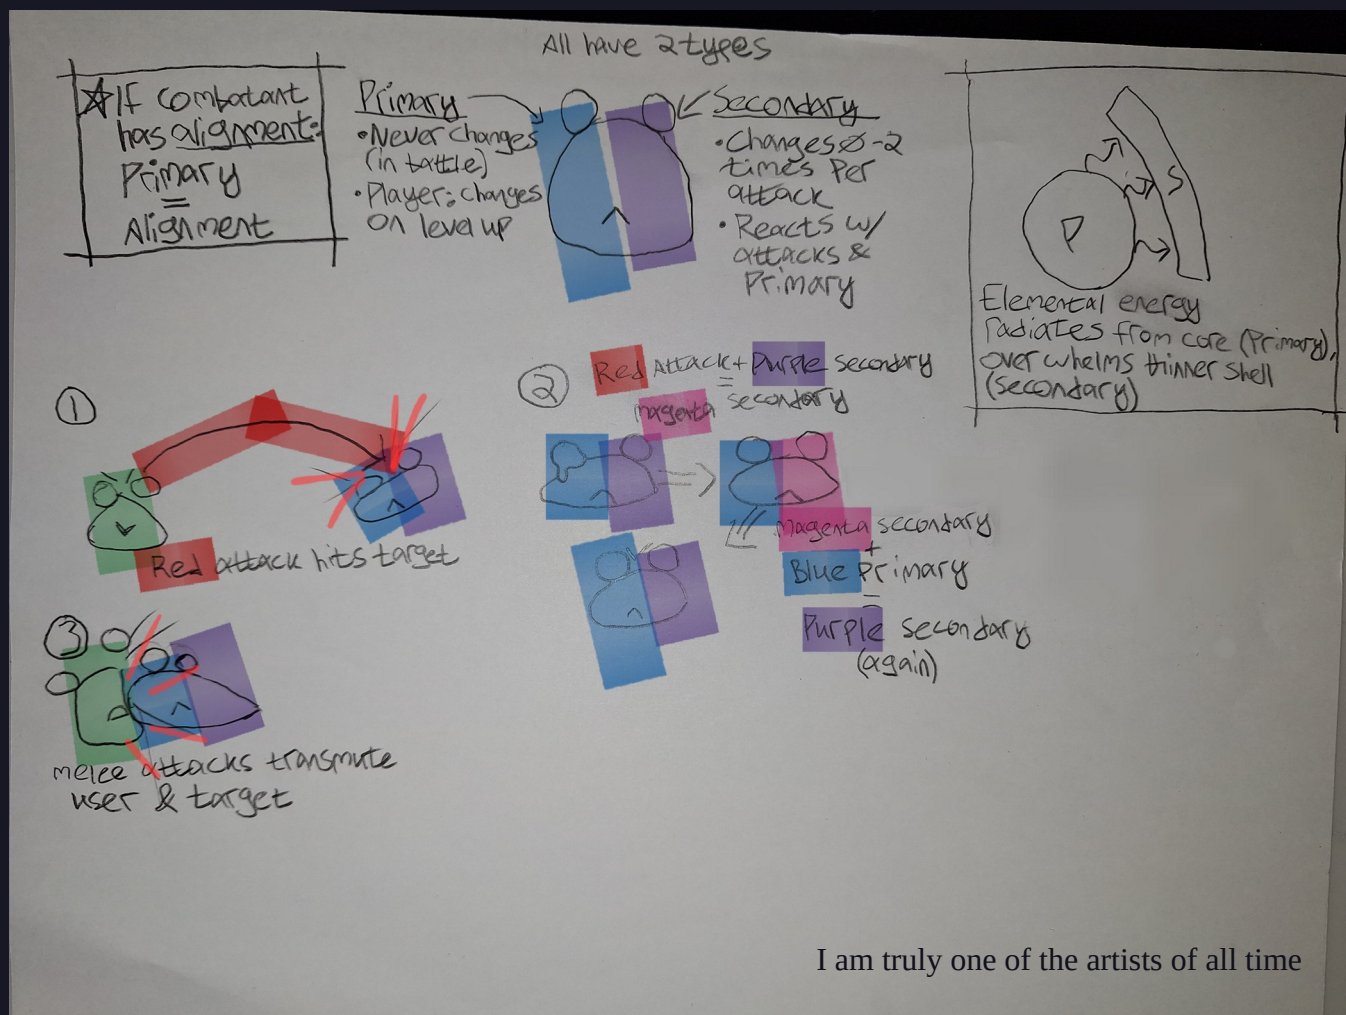

Rotmaxxing with the Boys

The Combat System (Transmutation in Practice)

So hopefully you've been following so far, because this is the part where we start to go off the deep end.

1: Transmutations

2: Side Effects

Pretty early in the design process, I realized there was a major issue. The central mechanic was transmutation, but the player had no reason to actually care about it. Like, a combatant would turn Red, but that didn't do anything. I had a few ideas, one of which being the side effects.

Every time a transmutation occurs, they'll get a stat boost. What stat boost? Depends!

The Elements are separated into 2 "affinity" groups, offensive and defensive. These aren't the best labels, because defensive types have damage attacks and vice versa, but they're the best labels I have, so....

Offensive	Defensive
Purple	Blue
Red	Magenta
Orange	Yellow
Green	Cyan

- If the combatant goes from an offensive type to a defensive type, they get a defense boost.
- If they go from a defensive type to an offensive one, they get an attack boost.
- If they stay in the same affinity group, they get a speed boost.

The astute among you might notice that this introduces an amount of power creep into every battle. This adds a layer of strategy, as if you do not transmute often enough you'll find yourself outpaced by your opponents.

I think its good idea conceptually. It may be a hacky method to force the player to engage with transmutations, but its my hacky method.

3: STAB

For any non-Pokemon-nerds reading this, STAB stands for Same Type Attack Bonus. Essentially, in Pokemon if a fire-type uses a fire attack, its 50% stronger. Of course, the way that this is implemented in my game isn't as straightforward, but, like, that should be obvious at this point.

I don't even think its fair to call it STAB, but its STAB adjacent. Essentially, all attacks have something called a scaling factor, which consists of 3 percentages. One, as you might imagine, is the power of this attack if either of the user's types match the attack's type. Exactly like STAB, except instead of being a set percentage, it varies from attack to attack. The other two numbers are for when the user is in the same affinity group (offensive/defensive) as the attack and for when the user shares no type or affinity group.

So for Pokemon, all attack scaling factors would look like: 100/100/150.

Admittedly, this is pushing it, but this system is pretty low-key, so the player doesn't really need to engage with it until they're ready to. I've tried to set it up in such a way that the player might not even realize its there until they get some late game attack that has crazy scaling factors.

4: Nothing Wrong With Me

So, that's enough about the current elemental system. But I'm worried you think I have no restraint and just keep adding stuff. Fair. But also:

I'm hoping I'm just overthinking the side effects, they feel pretty simple to me, especially now that I've restructured the battle tutorial to explain them better. But if you think its bad now, you should know that *this is the simplified version*.

Originally, each reaction had its own unique side effects. 2 stats would be sharply boosted and 1 would be slightly lowered, all based on the vibes of each Element. But that was complicated, so I cut it.

Speaking of needless complexity, I at one point tried to add a weakness/resistance system, like in more traditional type systems. Luckily, trying to write the tutorial for that proved impossible, which was a wake up call to axe it.

So yeah, I know that its a lot, but know that I am **trying** to incorporate player feedback to streamline it all into something more manageable. I intend at some point to add icons for each type, as well as shift the hues around to better match the mood and make them easier to distinguish. I also plan to do a big Elemental update, as the whole system is built on a prototype so there are some optimizations and fixes I need to do on the backend (and I should probably add the 2 missing reactions...)

Finally, I made a pretty major change to how the transmutations worked in combat. Your primary type being static for the duration of a battle was actually a relatively late addition. In the past, every time you'd get hit with an attack, there were up to 3 transmutations that could happen:

- Primary + Attack
- Secondary + Attack
- Primary + Secondary

If the third reaction happened, its result would become your new primary type. Your secondary type would become “blank” (essentially gray). If your secondary type was blank when you used an attack, it would change to match the attack's type. I changed it to the current system and added the current lore justifications to make it easier to explain.

The Elements (Brief)

In section 3 of this document, I plan to include a few vibe and narrative pieces that will help flesh out my ideas about each Element. But this section shows the broad strokes. Each section shows the general combat roles each type fills, a few thematic keywords, and comparable Pokemon/Cassette Beast types.

These are closer to the actual shades that will be used in game.

<u>Blue</u> Transmutation Speed Control Stagnation Stasis Mold Deep Sea (minor) Psychic, Astral, Water	<u>Magenta</u> Support Tank Creativity Art Carnivals Clowns Fairy, Glitter, Beast	<u>Yellow</u> Support Utility Flight Optimism Storms Air, Electric	<u>Cyan</u> Tank Mountains Exploration Engineering Ice, Steel

Technology and Sources

Documentation

If you think the color palette of this document seems random, its actually picked from a palette called [Catppuccin](#) (which I'm lowkey obsessed with). Right now the UI in my game is very utilitarian, but there's a good chance it will end up using this palette too.

My design document was done using [Obsidian](#), which is great for note taking. It uses a sort of wiki-esque structure, where you have multiple pages all linked together. The original version of this document was blocked out in Obsidian, but the final version you're reading was made using Libre Writer (Microsoft Word for nerds), which is easier to format.

Software

Godot is my game engine of choice, though admittedly I've only ever used it and Unity. Number 1 reason I use Godot over Unity is that it works on Void Linux. Reason number 2 is that Godot is open-source and Unity is proprietary. If I need to, I could alter the engine itself. I haven't needed to yet, but I could. Unity has also had some sketchy monetization policy, but I already said it was proprietary.

My code editor of choice is Neovim. If you like using keyboard shortcuts and have a high tolerance for jank, I'd recommend giving it a look.

Art

Blender runs on black magic and passion. The fact that it is free is truly insane, with the amount of features it has. The process of creating a rig to animate a model has at least 2 magic buttons where you press it and it does everything for you. While modeling, I pulled up a topology guide to try and make sure my character would texture properly, only to notice that the subdiv modifier was doing it for me. If Blender ever disappears from this planet, you *will* need to do a wellness check on me.

The clay shader I use to achieve my claymation aesthetic is [Claydoh](#). I bought it for like \$30. Its done all the heavy lifting for making my game and renders look good. I had to improvise my own for the terrain, but it is a hacky solution based on Claydoh's assets.

Most of my 2D assets were made in Blender, but I edit a lot of these in GIMP.

I haven't even attempted to do any sound or music in my game yet. I'll likely use a bunch of royalty-free assets, as I'm not even sure where to begin.

To create my transmutation map, I used this [Graph Editor](#). It runs a basic physics simulation, which helped me figure out the best layout.

Narrative

A lot of the ideas about the Elements are trapped as vibes inside my head. These short form works are trying to flesh out these ideas in a manner more communicable than “stasis” or “artist.” Everything else in this document served as an exposition dump to contextualize the following nonsense. Enjoy :) Or don’t :(

The Hotel by the Castaway

The air smells of mildew and the ragged carpet is damp under your feet. Its quiet... eerily so. You feel as if you are the first living thing to walk these corridors in quite some time.

You don’t remember how you got here. Your mind feels foggy. And when you focus for a moment too long, you become aware of a deep, pulsating sensation emanating from all sides. And, well, you can’t be too sure... the isolation and dehydration might have gotten to you... but you swear that that awful pulsing is trying to speak to you.

Blue Alignment by Dlarv

For the longest time, Blue-alignment was way more horrifying than the other Elements. Most of the other Elements were just like “person, but **Red**,” while the Blue-aligned barely resembled humans anymore. I’ve tried to dial down Blue’s body horror while dialing up the other Elements.

The main feature of Blue-alignment is becoming rooted in place. I’ve never seen Pirates of the Caribbean, but I understand that some of the pirates on Davy Jones’ crew have become one with the ship. Its a little like that. You lose the ability to move freely, but gain telekinesis, tentacles, and a deeper understanding of the world and magic.

Still definitely not my first choice for alignment.

On the Nature of Blue and Stasis by Cobalt

I wouldn’t say that the nature of Blue is decay, rather its more akin to eternal stagnation. Many people (those not of Blue) think my objection is with the negative connotations associated with these such words, but that couldn’t be further from the truth. Specifically, the part I take issue with is the connection to decomposition, a progress towards a new state. Change. Any conception of Blue that contains a concept of change fundamentally misunderstands the Element’s nature.

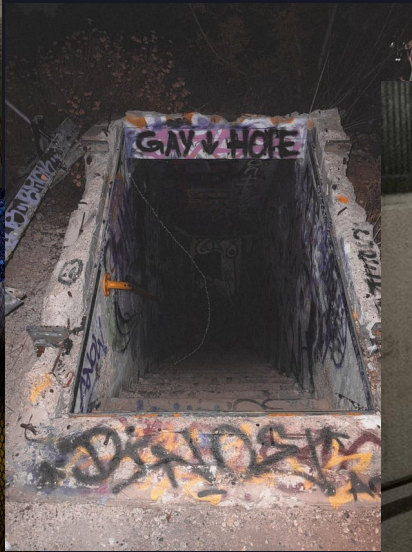

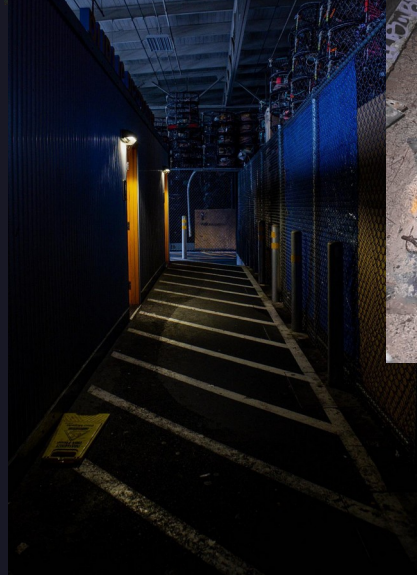

Blue is stasis. Blue is stagnation. Festering, decomposing, decaying all obscure this most important feature. On Earth, if you were to visit a moldy building over the course of a 100 years, you’d see the building collapse to dust. But the Hotel, stronghold of Blue, has stood, moldy and empty, for almost 1000, unchanged.

Rotmaxxing with the Boys, Except that I Forgot the Lens Flare Effect was Only Applied After the Render Finished, So I Turned it Up Way Too High

Purple by Violet

This island has a lot of psychic what-have-you going on. Red has their creepy cult hivemind and Orange has their brain internet type deal. Even Blue has some weird fungal mycelium nonsense. But everyone always forgets about our telepathic link. “How are you guys so well coordinated?!” “How do you always find us??” Because we’re psychic, obviously. We’re psychic, apex predators and you stumbled into our territory like an idiot. So now, we’re psychically hunting you down. To eat you, obviously.

*Oh to be in Purple Territory
Images taken from r/LiminalSpace*

Maintenance Tunnels by the Castaway

You thought you were getting the hang of this place...

You find yourself in what seems to be the maintenance tunnels. In a normal hotel, in a normal place, this section would surely be off limits. But there was no one here to stop you. You’d welcome the sight of a worker, a security guard, anyone really. At least they’d be able to take you to an exit... or keep you company as you both starve to death in this labyrinth.

The primary problem is that this place does not seem to follow the laws of euclidean space. Rooms seem to loop and double back on themselves. Backtracking only seems to take you deeper.

Perhaps this place will become your new home, among the pipes and concrete. Or your grave, if you do not find sustenance soon...

Conversation by 3MY and Sky

Sky: Wait, so its like... text?

3MY: yeah, and pictures, but those
tend to fade over time

Sky: But its all in your head?

3MY: yeah, I don't really get what's
so hard to understand about that

3MY: when you read a book, is that
not "text in your head?"

Sky: No, I hear a voice reading it to me

Sky: My voice

3MY: huh. Maybe that's why we're
so much smarter than you.

3MY: we're processing entire
sentences, while you all
are going one word at a time.

Sky: Dude, I saw you pull a push door earlier

3MY: that was *one* time.

3MY: but yeah, its mostly text.

3MY: we even have emoticons :)

*Purple Alignment by MIFLATEIOTMAIDAA**

Does the errant hum of distant generators get you
going in the morning?

Is your happy place a parking garage in the dead of
night?

Do you wish to be taller? Perhaps 2, 3 or even 4
times as much?

Do you have a bloodlust that only stalking across
the plains with you band of brothers will satisfy?

If you answered yes to any of these questions,
consider Purple-alignment today!

include: growth spurts, photophobia, homophobia, psychosis, and nausea.*

Playing with Fire: Red Magic and Red Alignment by the
EXPLORER

They say there are 2 types of Red mages: Those
that dabble and those who plunge, and both are
equally mad. I am not too sure about that latter
part, I can see the powerful allure of Red magic,
however perhaps I too am mad.

Dabblers can be noted by their reddish eyes and
ashen skin. The cultists are easier still to spot, with
scarlet robes and porcelain masks obscuring their
forms and faces. Or perhaps the masks are their
faces, who's to say... well, I suppose they could, if
they could stand my company and me theirs.
Conversations with these enigmatic figures has
proven difficult, for they possess a great paranoid
and distrust of outsiders. For now, I must satisfy
my scholarly inquisition with external observation.

The most striking characteristic of the congregates
of the cult of RED is their collective
consciousness, referred colloquially as the "Red
hivemind." Unlike those afflicted of Orange,
connection to this higher state is a late symptom of
this condition, presenting itself long after the
physical mutations have taken hold.

Through my observations, and from the
observations of their fellow islanders, once one's
mind is connected to this greater consciousness,
one will find their individuality leached away. This
fact is what truly separates the dabblers from the
cultists. Those who value their autonomy would do
well to avoid taking the plunge.

Magic by the Castaway

In the depths of the maintenance halls, in the depths of your despair, you stumble upon a storage closet. A weak, red light casts everything in ominous shadows, but you pay that no mind. Your only thought at this moment is finding something to eat.

Searching frantically through the boxes you find an... orb? It doesn't look like food, you're not sure why you're drawn to it. Its about the size of a baseball and glows with Green light. And as you examine it, you feel its power activating, filling your body with warmth. Your hunger and thirst subsides and your strength grows. It doesn't beat a granola bar, but it will do for now.

Flashlight by Dlarv

I had this random idea awhile ago about a character discovering a light spell and using it to navigate through the dark. And then they meet a more experienced sorcerer who freaks out, because its like some kind of powerful disintegration spell that happens to give off light. Like, the spell has two stages: the first where it charges up and glows, then being released in a devastating blast. The user never figured out how to activate the second stage, but they've essentially been flagging everything with a loaded gun.

I don't intend to use this as a plot point in the game and bring up this idea for no reason.

Orange Alignment by MIFLATEIOTMAIDAA

Do you need a podcast or music to fall asleep?

Can you listen to nerds argue about obscure topics all day long?

Do you miss doomscrolling at 3 am, helplessly watching the world fall apart before your eyes?

How does it sound to be on the cutting edge of science and technology, all while livestreaming to your friends and colleagues?

If you answered yes to any of these questions, consider Orange-alignment today!

Visit the Academy for details, safety not guaranteed. MIFLATEIOTMAIDAA is not liable for injuries or mutations. Side effects may include: insomnia, fever, osteomalacia, hubris, and an excess of eyes and mouths.

Rampage by the EXPLORER

Not everyone is built to understand the complexities of the world around them. At least, that is the only conclusion I can reach after stumbling upon the Eastern wing of the Hotel.

In the not-so-distant past, this place was a topological marvel, far bigger on the inside than one might first assume. From the hallway, it would appear that the hotel suites would either intersect or be far more narrow than desirable. But upon choosing a door and entering a suite one would be greeted by a spacious room, fit for a couple or small family.

Alas, this anomaly was far to much for a certain Mr. Miller to handle. In a desperate attempt to probe the world around him, he reached out with the only instrument he could handle: a crude sledge hammer. And now, this marvel of natural engineering is naught but rubble, its many rooms collapsed like a waveform into a dreary, mundane room.

Expedition 133A by Sky

Day 37 of exploring Antlyx Blvd. It is currently 16 hours after sunrise, the sun hangs just above the treeline. The sky shows signs of dusk rapidly approaching, however I did also say that 6 hours ago.

As Aqua theorized, it appears there should be an intersection with Tlosteria Rd, but no such intersection can be found. Like Tlosteria, Antlyx appears locally straight, at least from light 125 to light 166. I was able to get eyes on what appeared to be Tlosteria around light 147. Here Tlosteria could be seen diverging away in a matter consistent with extreme hyperbolic curvature. However, future expeditions should be conducted to confirm this is in fact Tlosteria.

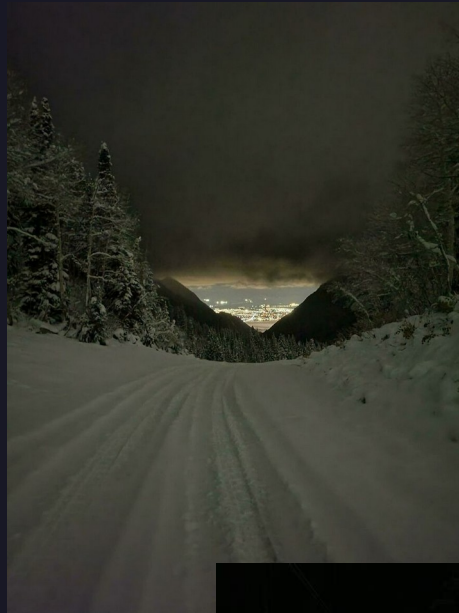

Besides the glimpse of Tlosteria (if it is indeed Tlosteria), no external landmarks have been found. Dense foliage and tall evergreens block all sight lines, similar to most other NW highways. Fauna is sparse, but evidence of Safyr presence can be noted, especially around the hillier sections of road (lights 114-135, 149-153, 178-179).

I intend to reach light 200 before turning around, which I anticipate I'll reach sometime tomorrow.

Cyan by Dlarv

The snowy mountains on the Northern edge of the island (refer to map on page 3) are considered to be Cyan territory. The main inspiration of Cyan is ice and steel, so its like rugged mountaineers with metallic skin surviving in a frigid wilderness.

Another inspiration are the liminal back road pictures. Cutting through the forests are empty roads, built by no one, for no one.

Cyan Inspo

Picnic at the End of the Road

Yellow Alignment by MIFLATEIOTMAIDAA Yellow :3
Are you easy going, lackadaisical, with a devil
may care attitude?

Do you wanna be?? ;)

Floating high above the clouds, every day is an
adventure waiting to happen!

Go where the wind takes you!

And if that's anywhere near the Tower, feel free to
drop by :) We'd love to talk to you about Yellow-
alignment today!!!

MIFLATEIOTMAIDAA is not liable for injuries. jkjk, you'll be perfectly fine, *Yellow Vibes*
we don't bite :3

~~Side effects may include forgetfulness, floatiness, and evaporation.~~
